# 1 • INTRODUZIONE

I prodotti GFX4/GFX4-IR/GFXTHERMO4 ordinati con l'opzione "E2", o comunque equipaggiati con la scheda GFX4-ETH2, implementano il protocollo EtherCAT Slave CoE (Canopen over EtherCAT) rispetto ai device host ad esso connessi.

Lo schema logico della comunicazione può essere esemplificato come in figura

## 2 · CARATTERISTICHE PRINCIPALI

- Data transport layer Ethernet II , IEEE 802.3
- Due connessioni RJ45 : Eth 0 IN ed Eth 1 Out
- Baud rate 100Mbit/s
- Supporto Canopen over EtherCAT CoE
- Supporto alla comunicazione SDO Master- Slave
- Supporto alla comunicazione PDO
- Supporto al Dizionario Oggetti tramite device description file (DDF)
- Complex slave device
- Possibilità di indirizzamento tramite 3 rotary

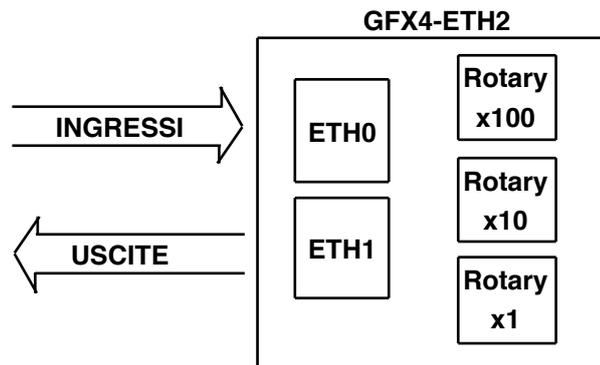

## 3 · CONNESSIONE FISICA ALLA RETE LAN

La scheda GFX4-ETH2 dispone di due connessioni RJ45 per il collegamento ad altri dispositivi slave o ad un master.

In particolare si possono identificare

- Una porta Eth0 per le connessioni in ingresso
- Una porta Eth1 per le connessioni in uscita

Esemplificando quanto detto si può far riferimento, in linea di principio, alla seguente modalità di connessione

## 4 · CONNESSIONE DEI DISPOSITIVI HOST

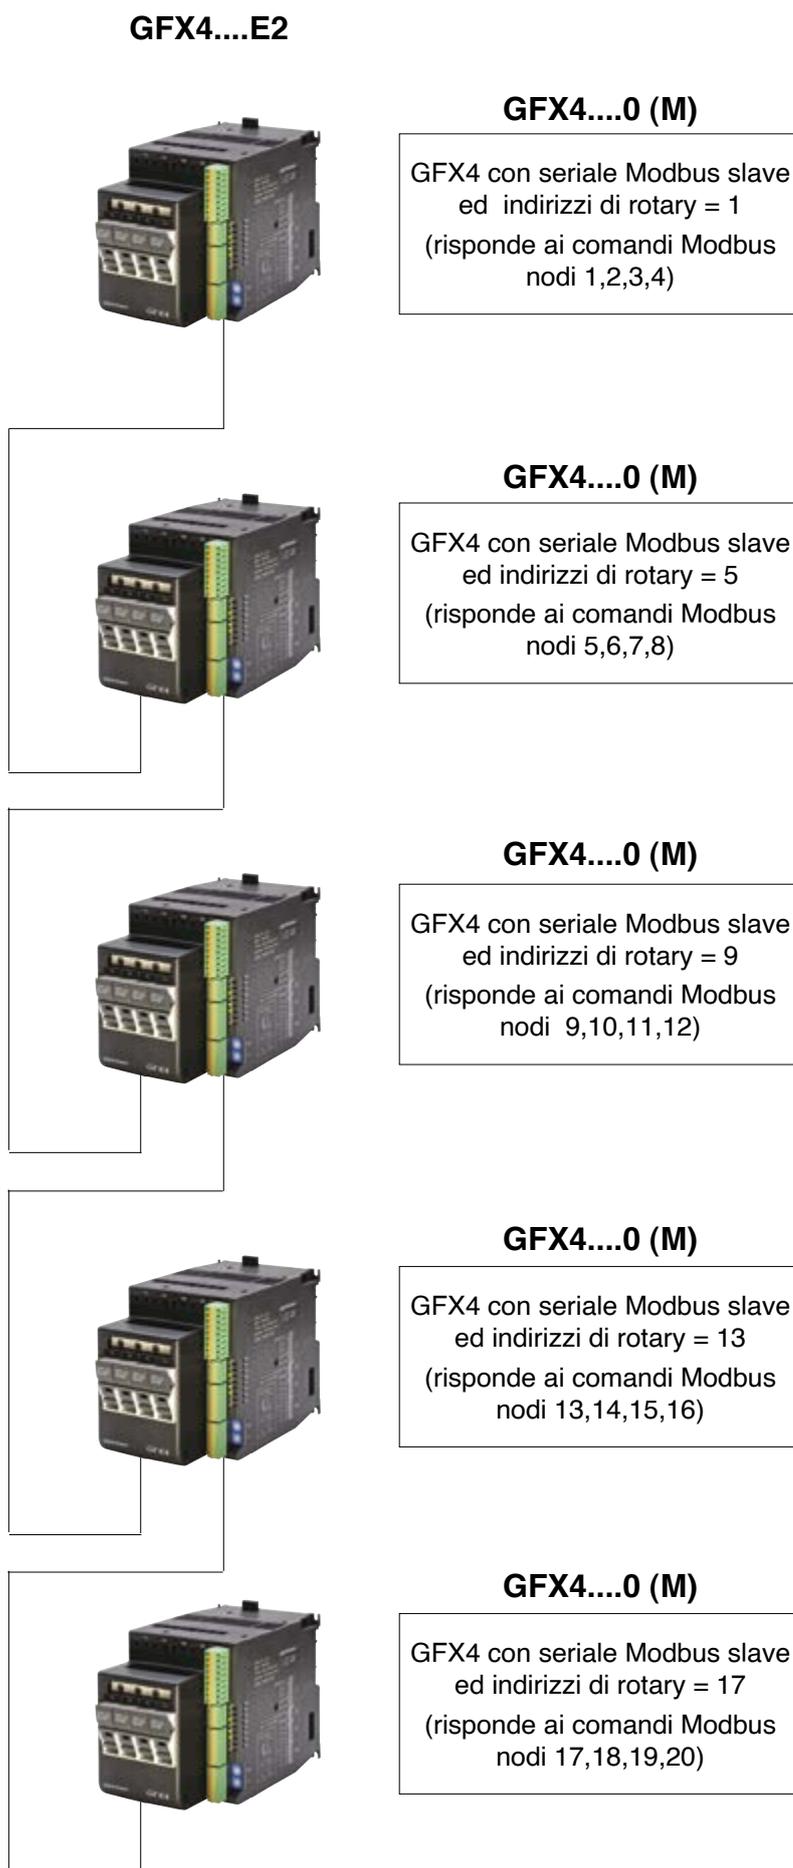

La connessione interna ai dispositivi host avviene tramite una connessione seriale (tramite incapsulamento delle informazioni con protocollo Modbus RTU).

Per una corretta connessione devono essere verificate le seguenti condizioni:

- La velocità di collegamento sia di 19200 baud
- Nessuna parità
- 8 bit di dato
- gli slave modbus devono avere indirizzo di nodo compreso tra 1 e 20

In questo tipo di connessione gli slave devono essere connessi come esemplificato in figura.

Esempio tipico di connessione con regolatori GFX4:

## **Vincoli temporali comunicazione seriale in Modbus RTU**

Per consentire il corretto scambio dati via seriale con il dispositivo, è necessario rispettare i seguenti vincoli temporali :

Letture parametri a register\word: La lettura di N parametri consecutivi, con N da 1 a 16, richiede un tempo pari a almeno 50 ms. Ne consegue che il successivo comando Modbus, sia di lettura che di scrittura, verso lo stesso nodo, dovrà essere inviato dopo aver atteso questo tempo.

Scrittura parametri a register\word: La scrittura di N parametri consecutivi, con N da 1 a 16, con un set completo di valori aggiornati (16 in totale), rispetto a quelli attualmente presenti sul dispositivo, richiede un tempo pari a :50ms + N x 80ms(\*) con N da 1 a 16. Ne consegue che il successivo comando Modbus, sia di lettura che di scrittura, verso lo stesso nodo, dovrà essere inviato dopo aver atteso questo tempo.

I tempi riportati si riferiscono al caso in cui il Baudrate della seriale (parametro bAu indirizzo Modbus 45), sia pari a 19200.

(\*) Qualora nella richiesta di scrittura vengano inseriti i parametri STATUS\_W (indirizzo Modbus 305), ed il loro valore fosse differente rispetto a quello attualmente presente nello slave, il tempo necessario alla scrittura di ciascuno diverrebbe pari a 240ms (anziché 80ms)

## **5 • DESCRIZIONE DEI DATI SCAMBIATI DA GFX4-ETH2**

Le informazioni che può scambiare lo slave etherCAT sono concettualmente divise in due tipologie :

- Dati di configurazione
- Dati di processo

Queste informazioni devono essere caratterizzate dal file descrittivo DDF del device collegato; il significato dei dati è noto solo alle applicazioni che ad alto livello devono manipolare questo flusso di bit. GFX4-ETH2 è a tutti gli effetti un bridge che fa passare le informazioni al suo interno.

A livello etherCAT di dati fluiscono da Master/Slave e viceversa , attraverso il meccanismo delle Mailbox Acicliche (dati lenti) o attraverso i canali ciclici per i dati veloci.

Internamente ad GFX4-ETH2 esiste un template destinato a contenere la struttura dei dati veloci PDO ed alcune semplici primitive per la gestione degli SDO.

La descrizione dei dati veloci PDO è contenuta negli oggetti che si occupano di descrivere il pdo mapping in ricezione/trasmissione e sono del tutto analoghi a quelli utilizzati nel CanOpen.

Tali oggetti sono “compilati” nella fase di startup dal master con una procedura di avvio nella quale lo slave viene appunto “inizializzato” in modo che si predisponga al trasferimento delle informazioni necessarie.

## **6 • DAL FILE DI DESCRIZIONE DDF ALLO SCAMBIO DATI**

Vediamo com'è possibile partendo da un file DDF arrivare a scambiare le informazioni con un sistema supervisore.

Nell'esempio pratico che andremo ad illustrare utilizzeremo un controllore GFX4 con la scheda opzione “E2”, il file DDF descrittivo del dispositivo GFX4\_001.xml ed un PC con software Twincat Manager della ditta Beckhoff.

Vediamo il contenuto dei dati di processo del file GFX4\_001.xml a corredo del controllore GFX4: in esso viene inclusa una rete composta da 20 zone (il massimo che GFX4-ETH2 può gestire) caratterizzata quindi da 20 PDO, uno per ogni zona, più un pdo in cui viene incapsulato nei dati processo un canale di comunicazione modbus Master; nel dettaglio vediamo la tabella con i dati mappati nei pdo.

Fare riferimento al manuale sw del GFX4 e del protocollo Modbus per una descrizione delle voci indicate in tabella.

## 7 · STRUTTURA DATI PROCESSO (PDO)

### 7.1. Descrizione dei pdo in ricezione per GFX4 con 20 zone

Nr. PDO in Rx	indice	sottoindice	Size in bits	Commento
0x1600 (size 7 bytes) Opzionale fixed	0x5c00	0	8	Host request Modbus Trigger
	0x5c01	0	8	Host request Modbus Node
	0x5c02	0	8	Host request Modbus Function Code

**Note:**

(1) A seconda del numero di PDO che si intende utilizzare

(2) A seconda del numero di zone collegate

### 8.3. Esempio installazione e configurazione da ambiente TwinCAT

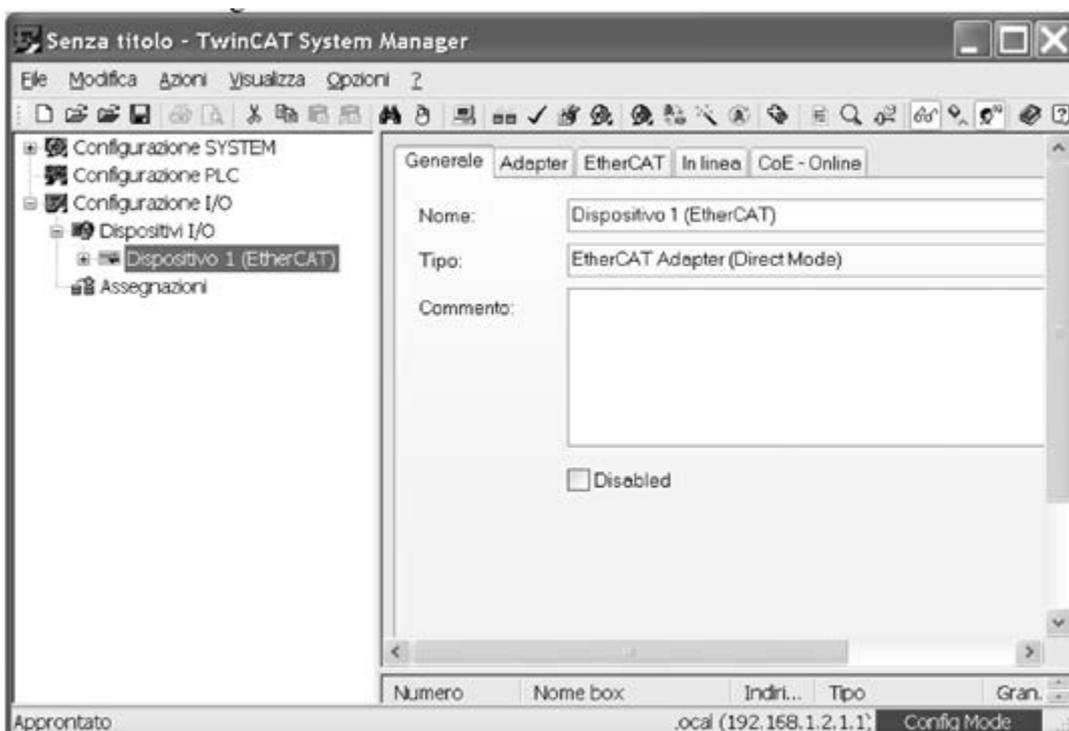

Dopo avere installato il sw TwinCAT in un elaboratore dotato di un ethernet controller compatibile (vedere la lista dei controllori compatibili Beckhoff Information System > TwinCAT > TwinCAT System Manager > Reference > I/O Devices > EtherCAT(Direct Mode) > Supported network controller ) eseguire i seguenti passi

- Ottenere il file GFX4\_001.xml/GFX4IR\_001.xml
- Rilocare il file nella directory di default di twincat c:\TwinCAT\Io\EtherCAT come mostrato in figura

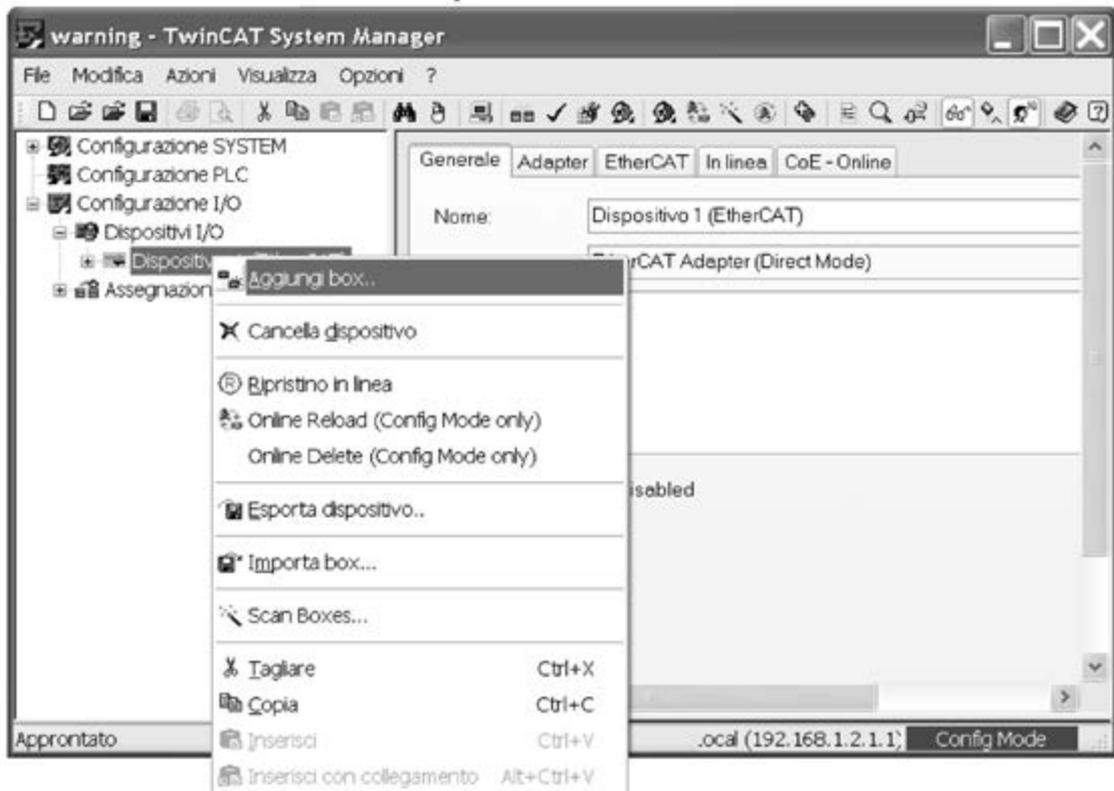

- Per garantire un aggiornamento del catalogo XML di Twincat riavviare il pc
- Avviare il sistema Twincat in configuration mode .

Il programma dovrebbe presentarsi come illustrato in figura

Aggiungiamo ora un box dal menù dispositivi I/O

Selezioniamo GFX4 20 zones

Avremo così la seguente struttura

Al termine della procedura potremo attivare il sistema in Run-Mode
